

EXPERIMENT-2

NAME: KARTHI D

ROLL NO : 240701230

Design a UI where users recall visual elements (e.g. Icons ,text ,chunks).
Evaluate the effect of chunking on user memory

Phase 1: Instruction Page

Purpose of the Screen

- Introduces the memory game and explains the rules clearly.
- Sets expectations for the player before starting.

Key Elements

- Title: *"Memory Game Instructions"* — immediately tells the user what the task is.
- Short description of the game flow: observe → memorize → recall → score.
- A highlighted **Start Game** button that signals the next step.

Cognitive & UX Benefits

- Breaking instructions into short sentences reduces cognitive load.
- Clear sequencing prepares the user mentally for the challenge.
- Emphasis on accuracy over speed encourages focus rather than rushing.

Phase 2: Chunking Phase (Memorization)

Purpose of the Screen

- This is the encoding stage where users view and memorize images.
- The countdown timer creates urgency and forces quick memory strategies.

Key Elements

- Title: *"Memorize these images!"* — directs attention to the task.
- Countdown timer (5 seconds) displayed prominently to reinforce time limits.
- Grid of 8 images shown for memorization.

Cognitive & UX Benefits

- Time pressure encourages chunking strategies (grouping by theme, color, or similarity).

- Grid layout makes scanning easier and supports pattern recognition.
- Short exposure time simulates real-world memory challenges.

Phase 3: Recall Phase (Selection)

Purpose of the Screen

- Tests memory retrieval by asking users to select the images they remember.
- Introduces distractor images to evaluate accuracy.

Key Elements

- Title: *"Select the images you saw before"*.
- Grid of mixed images (correct ones + distractors).
- Interactive selection with visual feedback (blue border when selected).
- Submit button to finalize choices.

Cognitive & UX Benefits

- Differentiating between seen and unseen items strengthens recall ability.
- Immediate visual feedback (highlighted border) makes interaction intuitive.

- Distractors test whether users can distinguish true vs. false memories.

Phase 4: Result Page

Purpose of the Screen

- Provides feedback on performance by showing the score.
- Allows the player to reflect on accuracy and decide next steps.

Key Elements

- Title: *"Result"*.
- Score display: *"Your score: X / Y"*.
- Restart option to replay the game.

Cognitive & UX Benefits

- Instant feedback reinforces learning and memory awareness.
- Simple score format makes evaluation clear and motivating.
- Restart option supports iterative improvement and replayability.

Result

Your score: 2 / 4
